### **Protectowire SRP-4x4 Fire Alarm/Releasing Control Panel Extended Range**

The SRP-4x4 was developed to answer the need for a flexible and cost effective Protectowire Control Panel for commercial and light industrial detection and extinguishing applications, and has a long history of quality and dependable performance.

As a result of customer feedback and in keeping with the Protectowire Company's policy of continuous product improvement, we have made several product enhancements designed to improve performance, and simplify installation and maintenance. These upgraded features for the 4x4 include:

- Expanded Protectowire zone lengths of up to 10,000 feet (3,048 m) per circuit.
- New meter conditioning circuit to improve alarm location accuracy.

The new upgrades provide double the detection area coverage, improved alarm point location accuracy and performance capabilities that meet or exceed most currently available competitive products.

Based upon our current estimate, shipment of the new versions of the control panel will begin approximately August 1, 2014. To ensure that the transition to the new version will be seamless for most customers, we cannot accept special requests to provide the new version of the panel for existing orders already in-house. The transition will be based solely on availability of parts and the implementation of revised manufacturing procedures.

Please take this opportunity to review the attached product data sheet. Now more than ever, the SRP-4x4 makes it easier to specify a complete single source Protectowire System with all of its unique features and reputation for reliability.

If you have any questions regarding the information contained in this mailing, please contact the Sales Department here at the Factory.

Sincerely,  
The Protectowire Company, Inc.
